SMARTLIVING

WIRELESS KEYPAD WITH LCD GRAPHIC DISPLAY

Control panel models

The control panel SmartLiving system is offered in 5 versions, all in metal enclosures.

SmartLiving505, SmartLiving515 and SmartLiving1050 with housing for a 7Ah battery, SmartLiving1050L and SmartLiving10100L with housing for a 17Ah battery.

The application range of this system spans from just five terminals with the "505" version, to a hundred terminals with the "10100" version.

The five control panel models are certified EN50131-3 Grade 3 and EN50131-6 Grade 2.

There are three certified Grade 3 ("G3") models also for EN50131-6 certification.

The technologies and the BUS

The **FlexIO** technology evolutionizes the static perspective of inputs and outputs and provides the installer with a more adaptable approach to system customization and what is more, a different perception of in-stock needs. SmartLiving allows the mapping of the terminals that distributes the available terminals on the peripherals (keypads and expansions) without "losing" the unused terminals. Application of **Easy4U** technology provides installers and end users the concept of "shortcuts" that makes system control effortless and greatly simplifies system programming, which is fully piloted by this straightforward interface.

Inim's **I-BUS** is capable of managing complex topologies, providing fast-load-insensitive response and end-to-end noise immune voice transmissions, all without need of any extra wiring.

The voice board **SmartLogos30M** offers voice over bus transmissions thanks to **VoIB** technology.

The bus accepts proximity readers, keypads with graphic displays, input/output expansions, wireless transceivers, GSM diallers and sounderflashers. The SmartLiving system is capable of enrolling all the bus peripherals automatically, thus further smoothing the process of system configuration.

The I-BUS can be protected, sectioned and regenerated by means of IB200 bus isolators/regenerators.

System functions, features and options

The SmartLiving control panels allows the correlation of the actions and **events** the system manages. Each of the system events can be associated with output actions, voice dialler actions and digital dialler actions.

The system can be accessed by user **codes** and proximity keys/cards. Each code/key/card has its own accesses to the partitions and the functions of the system. It is possible to associate each code with one of the timers which can then be programmed to enable/disable it at certain times of the day.

The system is capable of managing both hardwired and Air2"Air2" wireless peripherals. This type of configuration allows it to integrate the new-generation wireless capabilities provided by the "Air2" two-way transceiver.

The system offers an all-set-to-go Voice dialler and a likewise friendly Digital dialler that readily satisfies all the requirements of alarm receiving centres.

The SmartLiving system can also be accessed and controlled over-the-phone (PSTN) via the **SmartModem100** and **SmartModem200** modems.

If you wish to provide the system with an alternative communication channel over the GSM network, it is possible to use the **Nexus**. These GSM devices manage voice and digital communications, receives SMS commands and sends programmable SMS messages when specific events occur. The models **Nexus/G** and **Nexus/3G** allow remote programming and supervision of the control panel over the GPRS connection and communication with alarm receiving centres via SIA-IP protocol.

The **SmartLAN/SI** or **SmartLAN/G** optional boards provide TCP/IP connectivity. They allow end users/operators to access the system via the Internet and provide a web-server function. The latter allows end users/operators to connect to the control panel from any PC and verify the status of the system and interact with it.

The web server offers advanced features such as customizable interactive graphic maps, or the possibility to access ONVIF video verification functions.

In addition, all SmartLiving control panels are ready for **Cloud** connectivity. Through the use of a device as Nexus/G, Nexus/3G, SmartLAN/G or SmartLAN/SI, the SmartLiving panels can access to the revolutionary Inim Cloud service, which allows advanced management functionalities via the web. The connection of the control panels to the Cloud is "plug 'n play", that means that they do not require any configuration on the network on which they are installed. In this way all the control panel management is easily accessible from the web via browser and via app AlienMobile+ for smartphone and tablet.

The control panel can be programmed from any LCD keypad or via a PC running **SmartLeague** SmartLeague software. Programming from an LCD keypad is quick and easy, as it is possible to use the default settings which completely eliminate the need to configure the parameters of the Voice dialler and Digital dialler.

The high-speed RS232 port reduces local on-site programming to a split-second task.
